## Refurbish your AHU with IoT components to save energy, minimise cleaning & maintenance visits, and improve indoor air quality

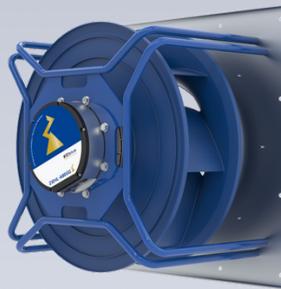

### Efficient

#### Cheaper Overall

Inspecting each AHU component, cleaning the coils & drain pans, and no guidance of when to replace filters, can rack up your costs quickly. The IoT components of MaintainAway enable you to focus your spend elsewhere. A small CapEx saves a lot of OpEx.

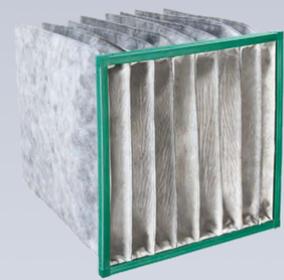

### Better

#### Optimal Energy Usage

Filters provided by AHU manufacturers & contractors are seldom selected for energy efficiency. G4 pre-filters and F7 final filters typically selected with most AHUs use more energy than necessary. MaintainAway allows for optimal maintenance and operation.

### Cleaner

#### Reduce Waste

Pre-filters are typically changed every 3 months. MaintainAway selects long-life filters using local outdoor air quality data, minimising filter changes. Our IoT components remove the need for routine cleaning and maintenance visits, and reduces waste.
